To accompany Unit 5.4: Models of Discrete-Time Systems

Colophon

This worksheet can be downloaded as a <u>PDF file</u>. We will step through this worksheet in class.

An annotatable copy of the notes for this presentation will be distributed before the second class meeting as **Worksheet 17** in the **Week 9: Classroom Activities** section of the Canvas site. I will also distribute a copy to your personal **Worksheets** section of the **OneNote Class Notebook** so that you can add your own notes using OneNote.

You are expected to have at least watched the video presentation of <u>Models of Discrete-</u> <u>Time Systems</u> of the <u>notes</u> before coming to class. If you haven't watch it afterwards!

After class, the lecture recording and the annotated version of the worksheets will be made available through Canvas.

Agenda

- Discrete Time Systems (Notes)
- Transfer Functions in the Z-Domain (Notes)
- Modelling digital systems in MATLAB/Simulink
- Converting Continuous Time Systems to Discrete Time Systems
- Example: Digital Butterworth Filter

Discrete Time Systems

In the lecture that introduced the z-transform we talked about the representation of a discrete-time (DT) system by the model shown below:

In this session, we want to explore the contents of the central block.

Example 5

Karris Example 9.10:

The difference equation describing the input-output relationship of a DT system with zero initial conditions, is:

$$y[n] - 0.5y[n-1] + 0.125y[n-2] = x[n] + x[n-1]$$

Compute:

- 2. The DT impulse response h[n]
- 3. The response y[n] when the input x[n] is the DT unit step $u_0[n]$

5.1. The transfer function

$$H(z)=rac{Y(z)}{U(z)}=\ldots?$$

5.2. The DT impulse response

Start with:

$$rac{H(z)}{z} = rac{z+1}{z^2 - 0.5z + 0.125}$$

MATLAB Solution

clear all cd matlab pwd format compact

See <u>dtm_ex1_2.mlx</u>. (Also available as <u>dtm_ex1_2.m</u>.)

The difference equation describing the input-output relationship of the DT system with zero initial conditions, is:

$$y[n] - 0.5y[n-1] + 0.125y[n-2] = x[n] + x[n-1]$$

Transfer function

Numerator $z^2 + z$

 $Nz = [1 \ 1 \ 0];$

Denominator $z^2 - 0.5z + 0.125$

Dz = [1 - 0.5 0.125];

Poles and residues

[r,p,k] = residue(Nz,Dz)

Hz = tf(Nz, Dz, -1)hn = impulse(Hz, 15);

Plot the response

```
stem([0:15], hn)
grid
title('Example 5 - Part 2')
xlabel('n')
ylabel('Impulse response h[n]')
```

Response as stepwise continuous y(t)

```
impulse(Hz,15)
grid
title('Example 5 - Part 2 - As Analogue Signal')
xlabel('nTs [s]')
ylabel('Impulse response h(t)')
```

5.3. The DT step response

$$egin{aligned} Y(z) &= H(z)X(z) \ &u_0[n] \Leftrightarrow rac{z}{z-1} \ &Y(z) &= H(z)U_0(z) &= rac{z^2+z}{z^2+0.5z+0.125} \cdot rac{z}{z-1} \ &= rac{z(z^2+z)}{(z^2+0.5z+0.125)(z-1)} \ &rac{Y(z)}{z} &= rac{z^2+z}{(z^2+0.5z+0.125)(z-1)} \end{aligned}$$

Solved by inverse Z-transform.

MATLAB Solution

See <u>dtm_ex1_3.mlx</u>. (Also available as <u>dtm_ex1_3.m</u>.)

open dtm_ex1_3

Results

Modelling DT systems in MATLAB and Simulink

We will consider some examples in class

MATLAB

Code extracted from <u>dtm_ex1_3.m</u>:

Ts = 1; z = tf('z', Ts);

 $Hz = (z^2 + z)/(z^2 - 0.5 * z + 0.125)$

```
step(Hz)
grid
title('Example 1 - Part 3 - As Analogue Signal')
xlabel('nTs [s]')
ylabel('Step response y(t)')
axis([0,15,0,3.5])
```

Simulink Model

See dtm.slx:

Results

Converting Continuous Time Systems to Discrete Time Systems

Continuous System Equivalents

- There is no digital system that uniquely represents a continuous system
- This is because as we are sampling, we only have knowledge of signals being processed at the sampling instants, and need to *reconstruct* the inter-sample behaviour.
- In practice, only a small number of transformations are used.
- The derivation of these is beyond the scope of this module, but here we'll demonstrate the ones that MATLAB provides in a function called c2d

MATLAB c2d function

Let's see what the help function says:

help c2d

Example: Digital Butterworth Filter

- Design a 2nd-order butterworth low-pass anti-aliasing filter with transfer function H(s) for use in sampling music.
- The cut-off frequency $\omega_c=20$ kHz and the filter should have an attenuation of at least -80 dB in the stop band.
- Choose a suitable sampling frequency for the audio signal and give the transfer function H(z) and an algorithm to implement h[n]

Solution

See digi_butter.mlx.

First determine the cut-off frequency ω_c

$$\omega_c = 2\pi f_c = 2 imes \pi imes 20 imes 10^3 ~ {
m rad/s}$$

wc = 2*pi*20e3

$$\omega_c = 125.66 \times 10^3 ~ \mathrm{rad/s}$$

From the lecture on filters, we know the 2nd-order butterworth filter has transfer function:

$$H(s)=rac{Y(s)}{U(s)}=rac{\omega_c^2}{s^2+\omega_c\sqrt{2}\,s+\omega_c^2}$$

Substituting for $\omega_c = 125.6637 imes 10^3$ this is ...?

Hs = tf(wc^2, [1 wc*sqrt(2), wc^2])

$$H(s) = rac{15.79 imes 10^9}{s^2 + 177.7 imes 10^3 s + 15.79 imes 10^9}$$

Bode plot

MATLAB:

```
bode(Hs,{1e4,1e8})
grid
```

Sampling Frequency

From the bode diagram, the frequency roll-off is -40 dB/decade for frequencies $\omega \gg \omega_c$. So, $|H(j\omega)| = -80$ dB is approximately 2 decades above ω_c .

w_stop = 100*wc

To avoid aliasing, we should choose a sampling frequency twice this = ?

 $\omega_s = 2 imes 12.6 imes 10^6$ rad/s.

ws = 2 * w_stop

So

 $\omega_s = 25.133 imes 10^6$ rad/s.

Sampling frequency (f_s) in Hz = ?

$$f_s=\omega_s/(2\pi)~{
m Mhz}$$

fs = ws/(2*pi)

$$f_s = 40.11~{
m Mhz}$$

Sampling time $T_s = ?$

 $T_s = 1/fs \ {\rm s}$

Ts = 1/fs

$$T_s=1/f_s=0.25~\mu{
m s}$$

Digital Butterworth

zero-order-hold equivalent

Hz = c2d(Hs, Ts)

Step response

step(Hz)

Algorithm

From previous result:

$$H(z) = rac{Y(z)}{U(z)} = rac{486.2 imes 10^{-6} z + 479.1 imes 10^{-6}}{z^2 - 1.956 z + 0.9665}$$

Dividing top and bottom by $z^2 \dots$

$$H(z) = rac{Y(z)}{U(z)} = rac{486.2 imes 10^{-6} z^{-1} + 479.1 imes 10^{-6} z^{-2}}{1 - 1.956 z^{-1} + 0.9665 z^{-2}}$$

expanding out ...

$$Y(z) - 1.956 z^{-1} Y(z) + 0.9665 z^{-2} Y(z) =
onumber \ 486.2 imes 10^{-6} z^{-1} U(z) + 479.1 imes 10^{-6} z^{-2} U(z)$$

Inverse 7-transform dives

$$y[n] - 1.956 y[n-1] + 0.9665 y[n-2] = \ 486.2 imes 10^{-6} u[n-1] + 479.1 imes 10^{-6} u[n-2]$$

in algorithmic form (compute y[n] from past values of u and y) ...

$$y[n] = 1.956 y[n-1] - 0.9665 y[n-2] + 486.2 imes 10^{-6} u[n-1] + \ldots
onumber 479.1 imes 10^{-6} u[n-2]$$

Block Diagram of the digital BW filter

As Simulink Model

digifilter.slx

open digifilter

Convert to code

To implement:

$$y[n] = 1.956y[n-1] - 0.9665y[n-2] + 486.2 imes 10^{-6}u[n-1] + 479.1 imes 10^{-6}u[n-1]$$

```
/* Initialize */
Ts = 0.25e-06; /* more probably some fraction of clock speed */
ynm1 = 0; ynm2 = 0; unm1 = 0; unm2 = 0;
while (true) {
    un = read_adc;
    yn = 1.956*ynm1 - 0.9665*ynm2 + 479.1e-6*unm1 + 476.5e-6*unm2;
    write_dac(yn);
    /* store past values */
    ynm2 = ynm1; ynm1 = yn;
    unm2 = unm1; unm1 = un;
    wait(Ts);
}
```
